

AF3 confidence filters retain the strongest Zn45 screening signals

Retrospective, single-scaffold data: model confidence has limited ranking value within the retained set.

Joint rule: `complex_plddt > 94` and `ipae_min < 1.5` | 211/378 mutants retained | 19/19 signals >1.5-fold retained

○ Excluded by joint rule (n=167) ● Retained, ≤ 1.5 -fold (n=192) ◆ Retained, >1.5-fold signal (n=19)

Each point is one mutant measured in one screening well; AF3 scores are means over five model samples.
The dashed horizontal line marks >1.5-fold screening signals. Fold is a blank-corrected reporter RFU slope ratio, not kcat or a validated hit. Colors use both score thresholds; a point may fail the threshold shown in the other panel.
